THEIR PREPARATION AND USE**

**TECHNICAL FIELD**

5

This invention relates to novel 1,4-diazabicycloalkane derivatives and their use in the manufacture of pharmaceutical compositions. The compounds of the invention are found to be cholinergic ligands at the nicotinic acetylcholine receptors and modulators of the monoamine receptors and transporters.

10 Due to their pharmacological profile the compounds of the invention may be useful for the treatment of diseases or disorders as diverse as those related to the cholinergic system of the central nervous system (CNS), the peripheral nervous system (PNS), diseases or disorders related to smooth muscle contraction, endocrine diseases or disorders, diseases or disorders related to neuro-degeneration, diseases  
15 or disorders related to inflammation, pain, and withdrawal symptoms caused by the termination of abuse of chemical substances.

**BACKGROUND ART**

20 The endogenous cholinergic neurotransmitter, acetylcholine, exert its biological effect via two types of cholinergic receptors, the muscarinic Acetyl Choline Receptors (mAChR) and the nicotinic Acetyl Choline Receptors (nAChR).

As it is well established that muscarinic acetylcholine receptors dominate quantitatively over nicotinic acetylcholine receptors in the brain area important to  
25 memory and cognition, and much research aimed at the development of agents for the treatment of memory related disorders have focused on the synthesis of muscarinic acetylcholine receptor modulators.

Recently, however, an interest in the development of nAChR modulators has emerged. Several diseases are associated with degeneration of the cholinergic  
30 system i.e. senile dementia of the Alzheimer type, vascular dementia and cognitive impairment due to the organic brain damage disease related directly to alcoholism. Indeed several CNS disorders can be attributed to a cholinergic deficiency, a dopaminergic deficiency, an adrenergic deficiency or a serotonergic deficiency.

#### Steric Isomers

## EXAMPLES

The invention is further illustrated with reference to the following examples, which are not intended to be in any way limiting to the scope of the invention as claimed.

### 25 Example 1

#### Preparatory Example

All reactions involving air sensitive reagents or intermediates were performed under nitrogen and in anhydrous solvents. Magnesium sulfate was used as drying agent in the workup-procedures and solvents were evaporated under reduced pressure.

30

1,4-Diazabicyclo[3.2.2]nonane (Intermediate compound) was prepared according to J. Med. Chem. 1993 **36** 2311-2320, and according to the following slightly modified method.

35

To the solution of 1,4-diazabicyclo[3.2.2]nonan-3-one (15.8 g, 113 mmol) in absolute dioxane (130 ml) LiAlH<sub>4</sub> (4.9 g, 130 mmol) was added under argon. The mixture was refluxed for 6 hours and then allowed to reach room temperature. Water (5 ml in 10 ml of dioxane) was added by drops to the reaction mixture, the mixture was stirred for 0.5 hour and then filtered off via glass filter. The solvent was evaporated

and the residue was distilled using Kugelrohr apparatus at 90°C (0.1 mbar) to yield 1,4-diazabicyclo[3.2.2]nonane (11.1 g, 78%) as colourless hygroscopic material.

1,4-Diazabicyclo[3.2.2]nonan-3-one (Intermediate compound)

5 To the solution of 3-quinuclidinone hydrochloride (45 g, 278 mmol) in 90 ml of water, hydroxylamine hydrochloride (21 g, 302 mmol) and sodium acetate ( $\text{CH}_3\text{COOH} \cdot 3\text{H}_2\text{O}$ , 83 g, 610 mmol) were added, the mixture was stirred at 70°C for 1 hour and then cooled to 0°C. The separated crystalline material was filtered off (without washing!) and dried *in vacuo* to yield 40.0 g of oxime.

10 The 3-quinuclidinone oxime (40.0 g) was added during 2 hours by small portions to polyphosphoric acid\* (190 g, prepared as described below\*), preheated to 120°C. The temperature of the solution during the reaction was kept at 130°C. After addition of all oxime the solution was stirred for 20 minutes at the same temperature, then transferred to an enamelled vessel and allowed to reach room temperature. The  
15 acidic mixture was neutralized by a solution of potassium carbonate (500 g in 300 ml of water), transferred into 2000 ml flask, diluted with 300 ml of water and extracted with chloroform (3x600 ml). The combined organic extracts were dried with sodium sulphate, the solvent evaporated and the solid residue dried up *in vacuo* to yield 30.0 g (77%) of the mixture of lactams.

20 Crystallization of the obtained mixture from 1,4-dioxane (220 ml) gave 15.8 g (40.5%) of 1,4-diazabicyclo[3.2.2]nonan-3-one as colourless large crystals with mp 211-212°C.

The filtrate was evaporated and the residue was chromatographed on a silica gel (Merck, 9385, 230-400 mesh) column with acetone as eluent. The solvent  
25 was evaporated and the residue recrystallized from ethyl ethanoate to yield 1,3-diazabicyclo[3.2.2]nonan-4-one (10.2 g, 26%) as colourless fine crystals with mp 125-126°C.

Polyphosphoric acid\*

30 85% Orthophosphoric acid (500 g, 294 ml, 4.337 mol) was placed into 2000 ml flask and then phosphor pentoxide (750 g, 5.284 mol) was added at room temperature (ratio acid-pentoxide, 2:3). The mixture was stirred at 200-220°C for 2 hours to yield of 1250 g of polyphosphoric acid, containing 80% of  $\text{P}_2\text{O}_5$ .

35 2-Chloro-5-phenyl-1,3,4-thiadiazole (Intermediate compound)

2-Amino-5-phenyl-1,3,4-thiadiazole sulfate (25.12 g, 142 mmol) was stirred in concentrated hydrochloric acid (300 ml) at 0°C. Sodium nitrite (12.7 g, 184 mmol) was added during a period of 10 minutes. The reaction mixture was stirred at 50°C for 15 hours. The hydrochloric acid was evaporated. Aqueous sodium hydroxide (4 M,

250 ml) was added and the the precipitate was filtered. Chromatography on silica gel with ethyl acetate as solvent gave a pure product. Yield 15.5 g (56%).

#### Method A

5 4-(5-Phenyl-1,3,4-thiadiazol-2-yl)-1,4-diazabicyclo[3.2.2]nonane fumaric acid salt  
(Compound A1);

10 ml) was added and the mixture was extracted twice with ethyl acetate (2 x 20 ml). Chromatography on silica gel with dichloromethane, 10% methanol and 1% aqueous ammonia as solvent gave the title compound as an oil. The corresponding salt was obtained by addition of a diethyl ether and methanol mixture (9:1) saturated with fumaric acid. Yield 0.95 g, 23%. Mp 150.9°C.

## 30 Example 2

### ***In vitro* Inhibition of <sup>3</sup>H- $\alpha$ -Bungarotoxine Binding in Rat Brain**

In this example the affinity of the compounds of the invention for binding to  $\alpha_7$ -subtype of nicotinic receptors is determined.

$\alpha$ -Bungarotoxine is a peptide isolated from the venom of the Elapidae snake *Bungarus multicinctus*. It has high affinity for neuronal and neuromuscular nicotinic receptors, where it acts as a potent antagonist.

<sup>3</sup>H- $\alpha$ -Bungarotoxine labels nicotinic acetylcholine receptors formed by the  $\alpha_7$  subunit isoform found in brain and the  $\alpha_1$  isoform in the neuromuscular junction.

### Tissue preparation

Preparations are performed at 0-4°C. Cerebral cortices from male Wistar rats (150-250 g) are homogenised for 10 seconds in 15 ml of 20 mM Hepes buffer containing 118 mM NaCl, 4.8 mM KCl, 1.2 mM MgSO<sub>4</sub> and 2.5 mM CaCl<sub>2</sub> (pH 7.5) using an Ultra-Turrax homogeniser. The tissue suspension is subjected to centrifugation at 27,000 x g for 10 minutes. The supernatant is discarded and the pellet is washed twice by centrifugation at 27,000 x g for 10 minutes in 20 ml of fresh buffer, and the final pellet is then re-suspended in fresh buffer containing 0.01% BSA (35 ml per g of original tissue) and used for binding assays.

### Assay

Aliquots of 500 µl of homogenate are added to 25 µl of test solution and 25 µl of <sup>3</sup>H-α-bungarotoxine (2 nM, final concentration) and mixed and incubated for 2 hours at 37°C. Non-specific binding is determined using (-)-nicotine (1 mM, final concentration). After incubation, the samples are added 5 ml of ice-cold Hepes buffer containing 0.05% PEI and poured directly onto Whatman GF/C glass fibre filters (pre-soaked in 0.1% PEI for at least 6 hours) under suction, and immediately washed with 2 x 5 ml ice-cold buffer.

The amount of radioactivity on the filters is determined by conventional liquid scintillation counting. Specific binding is total binding minus non-specific binding.

The test value is given as an IC<sub>50</sub> (the concentration of the test substance which inhibits the specific binding of <sup>3</sup>H-α-bungarotoxin by 50%).

The results of these experiments are presented in Table 1 below.
